

Prishtina International Airport "Adem Jashari" Limak Kosovo International Airport J.S.C.

Energy and Carbon Management Policy

The Management of Limak Kosovo International Airport J. S. C "LKIA" and all its employees are committed to give the best services at Terminal and Airside operations to passengers and airlines, and by being aware of the environmental impact that our operations cause, energy saving and emission reduction are a high priority.

Energy and Carbon Management is considered fundamental to our operations and we take a proactive approach on being efficient on energy resources and reducing emissions.

The aim of our policy is to display the organization's commitment in being environmental friendly. By identifying airport activities which are high energy consumers and those that emit high levels of carbon, it makes us able to create a framework which enables us to be efficient.

We also make sure that we continually comply with legal requirements of the Republic of Kosovo dealing with environmental issues. Aligned with its Corporate Social Responsibility, LKIA is committed to linking innovation and continuous improvement to meet new environmental challenges.

Our focus is using the latest efficient technologies and considering lower carbon alternatives while contributing to the planet's sustainable development.

In order to achieve the aim of the policy, our main tasks include:

- Identify in-efficiency and high levels of emissions in our activities,
- Reduce energy consumption and carbon emissions through a targeted yearly action plan,
- Continually review the result and impact of our actions in order to be sure that they are reaching the desired impact,
- Provide awareness of environmental impact among staff and other service users, by handling out regular trainings and using different types of communication,
- Ensuring that those we work with, our partner organizations as well as consultants, understand our commitment in being energy efficient and reducing carbon emissions.

Energy and carbon management activities will be subject to on-going review and will report the energy performance and carbon footprint of LKIA, and progress towards long term targets, on a monthly basis. The reports include details of energy consumption, carbon emission, key performance indicators and progress on energy and carbon management activities. 2014 is used as the base year. Annual reports will be prepared together with a documented review of this policy and its implementation.
